(August 17 – 20, 2015, California Polytechnic State University Pomona, CA)

Title: **Congruences for the Fishburn Numbers**

Presented by: **George Andrews and James Sellers**

ABSTRACT: This talk will present joint work with James Sellers. The Fishburn numbers, $x_i(n)$, have many interpretations (we will describe many of them in the talk). For example, $x_i(n)$ equals the number of upper triangular matrices with nonnegative integer entries and without zero rows or zero columns such that the sum of all the entries equals n . Thus $x_i(3)=5$; the relevant five matrices being:

```
100  20  10  11  3
010  01  02  01
001
```

In addition to discussing the numerous interpretations of $x_i(n)$, we will prove an infinite family of congruences for $x_i(n)$. The simplest of these being that 5 divides both $x_i(5n+3)$ and $x_i(5n+4)$.
