

Measuring Distance

Use the table below to record your distance measurements between two locations using nonstandard units of measurement. In the first column, record the two objects or spaces you're measuring. In the second column, record the unit you'll use to measure the distance. For at least three measurements, use your own feet as the nonstandard measurement tool. In the third column, estimate how many units you think will cover the distance. In the fourth column, record how many units you'll need to cover the distance.

Two Objects/Spaces You're Measuring (Distance between ____ and ____)	Unit Used to Measure the Distance	Estimated Number of Units Needed to Cover the Distance	Actual Number of Units Needed to Cover the Distance
