The Wire China

By David Barboza

China is a global leader in automation, particularly in the manufacturing sector, where millions of workers set to lose their jobs to robots. This has been a source of concern for governments around the world, as the shift towards automation poses significant challenges for societies and economies. However, China is not alone in its efforts to embrace automation. This trend is not only driven by economic necessity but also reflects broader patterns of global change.

What are some of the Chinese government's strategies to cope with this transition? How are workers and communities impacted by automation in China and elsewhere? And what lessons can be drawn from China's experience to inform policies and strategies elsewhere?

The Wire China delves into these questions, providing insights from experts and stakeholders on this complex and multidimensional issue. Through in-depth reporting and analysis, we aim to shed light on the challenges and opportunities presented by automation, and to contribute to a more informed and nuanced understanding of this global phenomenon.
